

Annual Drinking Water Quality Report for 2021
Village of Brownville
216 Brown Blvd.
(Public Water Supply ID#22002332)

INTRODUCTION

To comply with State regulations, Village of Brownville, will be annually issuing a report describing the quality of your drinking water. The purpose of this report is to raise your understanding of drinking water and awareness of the need to protect our drinking water sources. Last year, your tap water met all State drinking water health standards. We are proud to report that our system did not violate a maximum contaminant level or any other water quality standard. This report provides an overview of last year's water quality. Included are details about where your water comes from, what it contains, and how it compares to State standards.

If you have any questions about this report or concerning your drinking water, please contact Bill Pickett, DPW Superintendent, 782-7916. We want to be informed about your drinking water. If you want to learn more, please attend any of our regularly scheduled village board meetings. The meetings are held the second Tuesday monthly at 7:00 P.M. at the Village Offices/Fire Hall.

WHERE DOES OUR WATER COME FROM?

In general, the sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activities. Contaminants that may be present in source water include: microbial contaminants; inorganic contaminants; pesticides and herbicides; organic chemical contaminants; and radioactive contaminants. In order to ensure that tap water is safe to drink, the State and the EPA prescribe regulations which limit the amount of certain contaminants in water provided by public water systems. The State Health Department's and FDA's regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Our water system serves 1,650 people through 380 service connections. Our water source is groundwater wells: groundwater drawn from two drilled wells on Washington Street and Cape Vincent water system supplied through the Development Authority of the North Country pipe lines. The water is treated with chlorine as well as UV disinfection that is required by the New York State Department of Health prior to distribution.

The New York State Department of Health has completed a source water assessment for this system, based on available information. Possible and actual threats to this drinking water source were evaluated. The state source water assessment includes a susceptibility rating based on the risk posed by each potential source of contamination and how easily contaminants can move through the subsurface to the wells. **The susceptibility rating is an estimate of the potential for contamination of the source water, it does not mean that the water delivered to consumers is, or will become contaminated.**

The source water assessment has rated these wells as having a medium-high susceptibility to nitrates, microbial, and halogenated solvents. These ratings are due primarily to potential agricultural practices and a documented hazardous waste site within the wells outer assessment area. The wells draw from fractured bedrock and the overlying soils may not provide adequate protection from potential contamination. The New York State Department of Health will use this information to direct future source water protection activities. A copy of the assessment can be obtained by contacting the supplier of water.

ARE THERE CONTAMINANTS IN OUR DRINKING WATER?

As the State regulations require, we routinely test your drinking water for numerous contaminants. These contaminants include: total coliform, inorganic compounds, nitrate, lead and copper, volatile organic compounds, total trihalomethanes, and synthetic organic compounds. The table presented below depicts which compounds were detected in your drinking water. The state allows us to test for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data, though representative, are more than one year old.

It should be noted that all drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791) or the Health Department at 785-2277.

As the State regulations require, we routinely test your drinking water for numerous contaminants. These contaminants include: total coliform, inorganic compounds, nitrate, lead and copper volatile organic compounds, total trihalomethanes, and synthetic organic compounds.

Contaminate	Violation	Date of Sample	Level Detected (Avg/Max) Range	Unit of Measure MCLG	Regulatory Limit (MCL, TT, oral)	Likely Source of Contamination
Inorganic Compounds	No	08/16/17	<MCL	MG/L	0.002-250.0	Well Aquifer
Nitrate	No	10/06/21	<0.10	MG/L	10.0	Well Aquifer
Lead & Copper	No	08/12/20	Copper:2.0 Lead:0.007	MG/L	Copper:1.3 Lead:0.015	Residents Plumbing
Radiological: Gross Alpha Radium – 228 #2 Well #3 Well	No	08/18/20	Radium-228 0.804	pCi/L	Radium – 228 5	Well Aquifer
		----- 08/18/20	-----			
		08/16/17	Radium – 228 0.804			
Synthetic Organic Compounds	No		None Detected	MG/L	0.002-250.0	Well Aquifer
Total Coliform	No	Monthly	None Detected	MG/L	2	Distribution System
Triaholo-Methanes	No	009/08/21	0.092	MG/L	0.08	Distribution System
Haloacetic Acids	No	10/13/21	0.061	MG/L	0.06	Distribution System
Principle Organic Chemicals	No	08/16/17	None Detected	MG/L	0.005	Distribution System
Asbestos	No	08/06/21	None Detected	MF/L	7.0MF/L	Distribution System

Notes:

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which

there is no known or expected risk to health. MCLGs allow for a margin of safety.

Milligrams per Liter (MG/L): Corresponds to one part of liquid in one million parts of liquid (parts per Million-ppm)

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirement which a water system must follow.

***NOTE:** Triaholomethanes, Haloacetic Acids are over the limits. Collecting quarterly samples for a locational running annual average.

DO I NEED TO TAKE SPECIAL PRECAUTIONS?

Although our drinking water met or exceeded state and federal regulations, some people may be more vulnerable to disease causing microorganisms or pathogens in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice from their health care provider about their drinking water.

EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium*, *Giardia* and other microbial pathogens are available from the Safe Drinking Water Hotline (800-426-4791)

Although our system has an adequate amount of water to meet present and future demands, there are a number of reasons why it is important to conserve water:

- Saving water saves energy and some of the costs associated with both of these necessities of life;
- Saving water reduces the cost of energy required to pump water and the need to construct costly new wells, pumping systems and water towers; and
- Saving water lessens the strain on the water system during a dry spell or drought, helping to avoid severe water use restrictions so that essential fire fighting needs are met.

You can play a role in conserving water by becoming conscious of the amount of water your household is using, and by looking for ways to use less whenever you can. It is not hard to conserve water.

Conservation tips include:

- Automatic dishwashers use 15 gallons for every cycle, regardless of how many dishes are loaded. So get a run for your money and load it to capacity.
- Turn off the tap when brushing your teeth.
- Check every faucet in your home for leaks. Just a slow drip can waste 15 to 20 gallons a day. Fix it up and you can save almost 6,000 gallons per year.
- Check your toilets for leaks by putting a few drops of food coloring in the tank, watch for a few minutes to see if the color shows up in the bowl. It is not uncommon to lose up to 100 gallons a day from one of these otherwise invisible toilet leaks. Fix it and you save more than 30,000 gallons a year.

Thank you for allowing us to continue to provide your family with quality drinking water this year. In order to maintain a safe and dependable water supply we sometimes need to make improvements that will benefit all of our customers. The costs of these improvements may be reflected in the rate structure. Rate adjustments may be necessary in order to address these improvements. We ask that all our customers help us protect our water sources, which are the heart of our community. Please call our office if you have any questions.
